

## **Project InVision International announces Project InVision 8.6**

New release of on-demand project delivery solution extends capabilities in resource management

NOVATO, CA - October 9, 2008

San Francisco Bay Area-based Project InVision International (PII), a leading provider of on-demand software solutions, announced today the availability of Project InVision version 8.6, a new release of their Software-as-a-Service (SaaS)-based project delivery solution.

Project InVision 8.6 enables firms to automate a consistent and repeatable delivery process to increase efficiency, improve management visibility, and better utilize resources. The powerful new features in the Project InVision 8.6 include:

**Advanced Resource Skills Management** - This enhancement expands skills management capabilities offering the ability to group skills into categories, apply a proficiency rating for the skill, track the date it was last utilized, and add any additional skill-related comments. Through enhanced skills management, organizations can:

- identify skill deficiencies in particular areas and create plans to address deficiencies through training or recruitment;
- improve resource allocation across projects matching the 'right' resources to the 'right' set of projects;
- identify and assess employee skills strengths and weaknesses, as well as prepare development plans to improve skills;
- conduct core skills migration from aging skills sets to newer ones;
- reference resource skills in the performance management process, including appraisals and objective-setting; and
- redistribute and organize resources in times of restructuring and internal change.

**Miscellaneous Enhancements** - Project InVision version 8.6 includes hundreds of minor enhancements to improve the usability, stability and performance of the system.

The Project InVision SaaS-based project delivery solution consistently achieves the industry's fastest deployment times, enabling customers to focus on their strategic initiatives rather than laboring over the implementation of their project management system. Project InVision 8.6 breaks down the barriers associated with enterprise software deployments offering affordable subscription pricing and immediate availability to save companies hundreds of thousands of dollars in licensing and start-up costs.

### **About Project InVision International**
